

For this mobile, <whirligig-alpha> the center pole is aluminum mounted to a caster. It enables the mobile to move up and down while spinning like the lovely [Calder](#) mobiles.

The bicycle plastic flyer ribbons placement would have been better suited in the middle of the horizontal pipe to make more overall movement.

One of the wheels weighs more than the other resulting in very unexpected favoritism, such as only one side dipping more than another and a wheel not spinning uniformly bi-directionally.

I am working on aluminum welding next so I can more effectively make the necessary changes vs. cold jointing techniques.

Thanks for stopping by! ~brian

PS, i am ALWAYS open to suggestions or even designs to simply get busy with. please along any sketches to b.hogan@snhu.edu

PSS, my super gonger is on the right, awaiting a redwood disk and paddle before the tree hanging
